Behaviour Change for Achieving the Kunming-Montreal Global Biodiversity Framework EVIDENCE SYNTHESIS

Key recommendations

- Integrate behaviour change strategies with traditional conservation approaches to achieve the Convention on Biological Diversity's Kunming-Montreal Global Biodiversity Framework targets for 2030.
- Apply behavioural science methods to drive ethical, sustainable, and transformative change in addressing the behavioural challenges related to biodiversity conservation.
- Identify and specifically target the behaviours that need to change, and adopt multiple strategies, where necessary, to achieve sufficient behavioural change for major transformations.
- Leverage behavioural science to understand the patterns, barriers, and drivers of human behaviour that impact biodiversity, and use these insights to support effective monitoring and evaluation.
- Tailor strategies to the specific behaviours of individuals, communities, businesses, policymakers, organisations, and governments while considering how these groups influence each other.
- Include indigenous peoples and local communities in the design and management of behaviour change interventions which affect them to enhance the relevance and effectiveness of interventions.
- Use this evidence synthesis to explore key examples of successful behaviour change interventions that have achieved biodiversity conservation outcomes.

What is the purpose of this brief? This brief responds to knowledge gaps identified by the CBD's SBSTTA and the SBI in applying behaviour change approaches to achieve the Kunming-Montreal Global Biodiversity Framework targets (KM-GBF).

Who is it for? Policy decision-makers and practitioners aiming to deliver transformative behavioural change to support biodiversity. This brief provides evidence-based insights on behaviour change to address the KM-GBF targets.

1. Introduction to behaviour change

Human behaviours significantly impact biodiversity, both positively and negatively. Therefore, promoting behaviour change is essential to achieving the KM-GBF targets. Behavioural science leverages evidence-based insights into how people behave to shape policies and strategies for behaviour change. Disciplines such as psychology, behavioural economics, education, social marketing, and law and governance, contribute to our understanding of behaviour change.

A behaviour change intervention is a strategy designed to influence behaviours. Interventions can be directed at individuals, communities and groups, or decision-makers and governments, each requiring different strategies (Figure 1). The effectiveness of behaviour change interventions relies on identifying the specific behaviours to target, understanding the audience (those practising and influencing the behaviour), and recognising the barriers and enablers to change (such as values, knowledge, beliefs, assumptions, tools, costs, etc.).

Behaviour change in conservation can be challenging due to concerns about manipulation and perceived loss of autonomy, especially among indigenous peoples and local communities. Acknowledging these challenges, the FAIR Data Principles and the CARE Principles for Indigenous Data Governance should be adhered to throughout intervention design and implementation. Intervention designers and implementers should employ reflexive practices and approaches such as community co-design, and participatory engagement strategies. Alongside these, thorough ethics reviews and the application of appropriate safeguarding practices should be prioritised to ensure inclusive and respectful engagement throughout the design of interventions.

While no single method is a silver bullet for biodiversity conservation, effective behaviour change strategies can complement traditional conservation strategies to support long-term biodiversity goals. Until recently, understanding human behaviours and how to influence them has been a missing and crucial step in traditional conservation approaches. Galvanising political will and developing policies to support the critical application of behaviour change in conservation are required to lead to transformative change.

2. Evidence of behaviour change addressing the KM-GBF targets

Strategies

Six macro-level strategies are widely used in behaviour change interventions for biodiversity conservation (Figure 1.). These strategies can address the main drivers of behaviour change, such as those identified in a **toolkit for practitioners**, which demonstrates how to motivate, socialise, and ease the change. Behaviour change strategies require different delivery mechanisms, e.g., media, communications, and laws. These can be used in isolation or combined, depending on target audience drivers and deterrents and the specific context or enabling environment for change. Planning and implementing an effective behaviour change intervention can take many forms. However, robust pre-testing, monitoring and evaluation are essential requirements across all strategies to improve behaviour change for biodiversity.

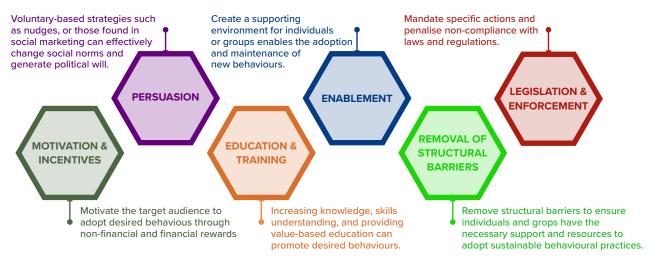

Figure 1. Six key strategies for behaviour change in biodiversity conservation. Descriptions and examples of each strategy can be found on the online resource repository [add URL link].

Case studies

A diverse selection of effective behaviour change interventions for biodiversity are illustrated below, with examples drawn from across these six strategies to demonstrate their contributions to achieving KM-GBF targets 4, 5, 10, and 16. These targets were chosen as exemplar studies of behaviour change for biodiversity from a review of approximately 80 case studies across the 23 KM-GBF targets. However, there is limited evidence of effective interventions targeting communities, companies, and governance structures. Therefore, most of the interventions showcased here target individuals. There are significant opportunities to widen the application of behaviour change outside of individual behaviour.

TARGET 4: Halt species extinction, protect genetic diversity, and manage humanwildlife conflicts

Ensure urgent management actions to halt human induced extinction of known threatened species and for the recovery and conservation of species, in particular threatened species, to significantly reduce extinction risk, as well as to maintain and restore the genetic diversity within and between populations of native, wild and domesticated species to maintain their adaptive potential, including through in situ and ex situ conservation and sustainable management practices, and effectively manage human-wildlife interactions to minimize human-wildlife conflict for coexistence.

To achieve TARGET 4, behaviour change strategies can help to successfully prevent or manage human-wildlife conflict and species extinction, which are typically underpinned by legislation and regulation, coupled with law enforcement by ensuring compliance and shifting supporting social norms related to this target.

4.1 Maasai-Lion coexistence

Country – United Republic of Tanzania.

Target behaviour – Retaliatory killings for livestock loss and human-lion conflict.

Target audience – Maasai communities in Tanzania.

Strategy – Financial payments to enable coexistence, conditional on continued local lion population.

Impact – Individuals were more likely to view lions positively and less likely to support killings.

Key message – Reliable funding, community collaboration and trust are required to manage payments successfully and sustainably.

4.2 Pet parrot demand

Country – Kingdom of the Netherlands (Bonaire, St Eustatius and Saba).

Target behaviour – Lora parrots being kept as pets.

Target audience – Population of Bonaire Island.

Strategy – Social marketing and education programmes.

Impact – Increased wild parrot population by shifting social norms and lowering demand for parrots as pets.

Key message – A combination of interventions is required for long-term behavioural impacts that lead to wildlife population increases.

4.3 Environmental education

Country - Indonesia.

Target behaviour – Illegal hunting and deforestation.

Target audience – School children (aged 5-17).

Strategy – Long-term conservation education programme (including bimonthly lessons and conservation education activities at schools, coupled with games, hands-on activities, quizzes, and a field trip).

Impact – Increased knowledge among children, no biodiversity impact in the short term.

Key message – Education can contribute to long-term efforts for generational change but not rapid impacts on species.

TARGET 5: Ensure sustainable, safe and legal harvesting and trade of wild species

Ensure that the use, harvesting and trade of wild species is sustainable, safe and legal, preventing overexploitation, minimizing impacts on non-target species and ecosystems, and reducing the risk of pathogen spillover, applying the ecosystem approach, while respecting and protecting customary sustainable use by indigenous peoples and local communities.

To achieve TARGET 5, behaviour change can affect behaviours along all nodes of the demand-supply chain to help ensure sustainable, safe and legal harvesting and trade of wild species. This aligns closely with TARGET 9: Manage Wild Species Sustainably To Benefit People by helping to ensure harvested species viability in the long term, contributing to people's well-being, especially those living in vulnerable situations.

5.1 Sustainable fishing practices

Countries – Brazil, Indonesia, and the Philippines.

Target behaviour – Sustainable fishing practices (e.g., no-take zone compliance; catch reporting).

Target audience – Small-scale artisanal fishery community members.

Strategy – Social marketing campaigns and TURF-Reserves (Territorial User Rights for Fishing combined with notake marine reserves).

Impact – Improvement of most sustainable fishing practices (e.g., management participation) and sustainable livelihood indicators (e.g., political trust) across all countries. Biomass gains in some of the intervention sites.

Key message – Social marketing behaviour change campaigns can act as tools to help managers overcome the short-term challenges faced when implementing new management regimes.

5.2 Saiga horn usage

Country - Singapore.

Target behaviour – Use of saiga horn (medicinal).

Target audience – Chinese Singaporean women aged 35-59 who consume saiga antelope horn.

Strategy – Online strategy using adverts to amplify news articles.

Impact – The target audience was significantly more likely than the non-target audience to accurately recall the intervention message and to report a decrease in saiga horn usage, to a limited extent (4% versus 1% reported a behaviour change).

Key message – Messages about the environmental impacts of behaviours may not easily influence consumers, particularly high-usage consumers. A range of message types should be tested with target audiences.

5.3 Wild meat consumption

Country - Brazil.

Target behaviour – Wild meat consumption.

Target audience – Residents of the Tapauá municipality.

Strategy – Social marketing campaign and an economic incentive (discount coupons for chicken).

Impact – Social marketing without the price incentive reduced wild meat consumption by 62%. Coupons (incentives) increased chicken consumption but did not reduce wild meat consumption.

Key message – Social marketing can promote behaviour change related to wild meat consumption, but understanding consumer preferences is essential for reducing demand for wildlife products.

TARGET 10: Enhance biodiversity and sustainability in agriculture, aquaculture, fisheries, and forestry

Ensure that areas under agriculture, aquaculture, fisheries and forestry are managed sustainably, in particular through the sustainable use of biodiversity, including through a substantial increase of the application of biodiversity friendly practices, such as sustainable intensification, agroecological and other innovative approaches, contributing to the resilience and long-term efficiency and productivity of these production systems, and to food security, conserving and restoring biodiversity and maintaining nature's contributions to people, including ecosystem functions and services.

To achieve TARGET 10, behaviour change strategies can address the unique behaviours across the supply networks from individual fishers to community farming associations, to government forestry departments. This can help to build environmental sustainability and economic viability in resource management.

10.1 Agricultural practices 10.2 Fishing fleet reduction 10.3 Agricultural restoration Country – Bangladesh. Country - China. Target audience – Fishers with trawl Target audience – Rural producers Target audience - Smallholder in the states of Goiás, Maranhão, vessels in Zhejiang Province. farmers in the Cumilla District. Mato Grosso do Sul, Minas Gerais, Strategy - Reducing harmful fishery and Tocantins. **Strategy** – Training focused subsidies and increasing vessel on capacity building through retirement subsidies. **Strategy** – Training and long-term participatory activities and technical assistance. Impact - Reduced fleet capacity via interactive learning. the retirement of older and smaller Impact – Incorporating carbon Impact – Increased crop income fishing vessels. savings amplifies return on and reduced agroecological impact investment while improving soil Key message – Tailoring from pesticide use. quality in terms of productivity — net interventions to the changing policy emissions reduction of 1.11 million **Key message** – The success of the reform context was crucial for tonnes of CO2 per year. training intervention was predicated effective implementation. on tangible financial benefits to Key message - Customised participants. information to the specific target audience ensured the intervention was effective in scaling up for sustainable intensification.

TARGET 16: Enable sustainable consumption choices to reduce waste and overconsumption

Ensure that people are encouraged and enabled to make sustainable consumption choices, including by establishing supportive policy, legislative or regulatory frameworks, improving education and access to relevant and accurate information and alternatives, and by 2030, reduce the global footprint of consumption in an equitable manner, including through halving global food waste, significantly reducing overconsumption and substantially reducing waste generation, in order for all people to live well in harmony with Mother Earth.

Behaviour change can support the delivery of TARGET 16 by reducing waste and avoiding overconsumption, which are direct consequences of everyday lifestyle decisions, as well as strategies implemented by businesses and governments providing goods and services. Behavioural insights can deliver waste reduction and more sustainable consumption while generating cost savings for government and businesses in the form of reduced waste management costs.

16.1 Plastic consumption 16.2 Vegetarian meals 16.3 Cutlery waste Country - Portugal. Country - United Kingdom of Great Country - China. Britain and Northern Ireland. Increased by between 41% and 79%. annually if implemented nationwide). **Key Message –** Positive messaging **Key Message –** Barriers to more Key Message - Changing default can significantly reduce the use of sustainable choices can be removed options and providing financial non-essential items, which helps to by providing alternatives and incentive reward schemes are useful decrease waste and save costs. changing default options, which methods to encourage consumers means consumer choices can be to reduce consumption. influenced or existing preferences

3. Policy implications

To increase long-term compliance with biodiversity legislation, behaviour change interventions should
focus on improving the perceived legitimacy of underlying laws. Co-design practices that actively involve
indigenous peoples and local communities are crucial for this process. Empowering these communities
ensures that interventions are culturally relevant and more likely to be embraced, leading to sustainable
compliance and transformative change.

expressed.

- Sustainable behaviour change requires a dual approach: coupling short-term, impact-focused interventions
 with longer-term, value-based education and social norm influence. This combination ensures immediate
 behavioural shifts while embedding deeper, lasting values that support biodiversity. Educational campaigns
 should be designed to evolve, reinforcing initial gains with sustained awareness and knowledge.
- Behaviour change strategies show promise as complementary tools to traditional conservation efforts,
 particularly in promoting sustainable, safe, and legal trade in wild species. However, to fully understand the
 effectiveness of these interventions, it is essential to incorporate causal impact evaluations. Such evaluations
 will help clarify the relationship between behavioural changes and their impacts on biodiversity outcomes.
- Implementing capacity-sharing initiatives, educational campaigns, financial incentives, and community
 engagement can effectively promote sustainable practices for example in agricultural and fishery sectors.
 When strategies are coordinated and targeted, they can influence a broad spectrum of society, including
 consumers, communities, organisations, and governments, driving widespread behavioural change that
 supports biodiversity conservation.
- Consumer purchase choices are influenced by how options are presented to them, and by reminders
 of their pro-environmental values. Interventions should be designed to strategically present sustainable
 options in ways that align with consumers' environmental values, thereby nudging them voluntarily towards
 behaviours that support biodiversity. This could include clear product labelling, strategic default options,
 and educational messaging.

4. Further resources on behaviour change for biodiversity conservation

This brief introduces behaviour change evidence in biodiversity conservation and gives examples of best practices using case studies. We conducted a rapid review of available open-access evidence to guide the contents of this report. This synthesis was supported by integrating insights from expert consultation with academics and practitioners working in behaviour change across multiple disciplines and environmental fields.

All resources synthesised in this review can be found in an online repository. Access this repository by scanning the QR code provided or using the link: [add URL link].

Search the online repository to find:

- 75 case studies of behaviour change for biodiversity conservation
- · Key behaviour change resource directories, guidance documents for practitioners
